The present sequence is parvovirus non-structure protein 1 (NS1) variant (T363A). The invention relates to the variants of the parvovirus non-structure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the cytotoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-AUG-
                                                                                                                                                                                                      Novel parvovirus non-structure protein variant, useful for treating tumoral diseases, has a shifted equilibrium between DNA replication and transcription activities, and cytotoxic activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel parvovirus non-structure protein variant, useful for treating tumoral diseases, has a shifted equilibrium between DNA replication and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (T463A). The invention relates to the variants of the parvovirus non-
structure protein (NS1) having a shifted equilibrium between the DNA
replication and transcription activities, and the cytotoxicity activity.
These variants are useful as toxins for treating tumoural diseases. The
variant DNAs are useful as vectors for gene therapy. (Updated on 06-AUG-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  11-OCT-2001
                                                                                                                                                                                                                      ABG03712;
                                                                                                                     ABG03712
                                            용
                                                                                                                                                                                             The present sequence is a parvovirus wild-type non-structure protein 1 (NS1). The present invention relates to the variants of the parvovirus non-structure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the cytotoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-AUG-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The inventors claim an immunologically active polypeptide for the development of vaccinal immunity against parvovirus infection. Also claimed are DNA sequences wholly or partly duplicative of defined sequences. The polypeptides are used in vaccines for conferring protection against parvovirus infections in man and animals. reaction (PCR) primers, oligomers, and for chromosome and gene mapping, reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in diagnostics as expressed sequence tags for identifying expressed in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cartivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic and amino acid sequences.
                                                                                           The invention relates to isolated polynucleotide (I) and polypeptide (II)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

0157:H7-specific nucleic acid molecule. A polynucleotide of the invention has anti-bacterial activity. The polypeptide can be used in detection has and/or treatment of 0157:H7 infection. The nucleotide sequence of the genome of Enterchaemorragic E coli 0157:H7 was determined. The present sequence represents an E. coli 0157:H7-specific polypeptide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Enterohemorragic Escherichia coli 0157:H7-specific nucleic acid molecule and a polypeptide and its use, a polypeptide, a vector and a host cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel enterohaemorragic Escherichia coli
                                                                                                                                                        Enterohaemorragic E. coli 0157:H7-specific protein SEQ ID NO: 1121.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Score 45; DB 7; Length 250;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Talin binds to vinculin and this is reduced on incubation with, e.g. Vinl Talin binds to vinculin and this is reduced on incubation with, e.g. Vinl Talin binds to vinculin and this is reduced on incubation with, e.g. Vinl 2.1. Vinl2.1 is a specific vinculin binding peptide generated from a TSAR (Totally Synthetic Affinity Reagent) 12 library. Many changes at the Neternatus are not disruptive whereas most changes at the C-terminus are disruptive. Mutagenesis of Vinl2.1 was carried out deliberately contaminating the precursor reservoirs used to construct the contaminating the precursor reservoirs used to construct the vinculin binding TSARs may alter the mobility or attachability of malignant cells, binding TSARs may alter the mobility or attachability of malignant cells, perhaps preventing or inhibiting metastaels. The TSARs are new and/or improved heterofunctional binding fusion proteins that have affinity for the ligand vinculin, and can be used to modulate the activity of the pharmaceuticals, etc. Other TSARs can be designed to bind dynein and glutathione-S-transferase. Typical applications are: (i) inhibition of GST to treat cancers that produce high levels of this enzyme; (ii) attenting mobility/attachment of malignant cells, modulating platelet release and blood clotting, for TSARs directed against vinculin; (iii) TSARs against dynein are used to modulate nerve cell activity, sperm motility, mobility of protozoa, etc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Identifying peptide(s) that bind specifically to dynein, vinculin or enzymes, eg. glutathione-S-transferase - by screening random peptide libraries, useful e.g. in immunoassays, affinity purification., tumour treatment, etc.
                                                                                                                                                                                                                                                                                           totally synthetic affinity reagent; vinculin; dynein; enzyme; heterobifunctional binding fusion protein; glutathione S-transferase; cancer treatment; nerve cell activity; modulate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The invention relates to a complex of protein-protein interactions between a Shigella flexneri polypeptide (e.g. ospB, ospD1, ipaD, ipaC, ipaH9.84 ospG and ospC1) and a mammalian polypeptide defined in the specification. The complexes are formed using the yeast two-hybrid system. Also included are (1) a recombinant host cell expressing the interactions between the Shigella flexneri polypeptide and a mammalian polypeptide defined in the specification; (2) selecting a modulating compound that inhibits or activates the protein-protein interactions; (3) a modulating compound obtained from the method of (2); (4) a SID (2) (3) a selected interacting domain) polypeptide or its fragment or variant comprising the human polypeptides appearing as ABG70042-ABG70242; (5) a SID polymucleotide or its fragment or variant comprising the above polypeptides a vector comprising (5); (6) a recombinant host cell containing the vector; and (10) a protein chip comprising shigella .

Clexneri polypeptide and a mammalian polypeptide defined in the specification. A pharmaceutical composition comprising the compound, belighted to polypeptide is useful for treating or preventing shigellosis (bacillary dysentery) in a human or mammal. The present sequence represents a human prey protein isolated by the yeast two-hybrid assay, forming a complex of the invention with a shigella protein
                                                                                                             flexneri polypeptide and a prey mammalian or human placenta polypeptide
for treating or preventing bacillary dysentery in a mammal or human.
                                                                                     New complex of protein-protein interactions between a bait Shigella
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Hexosaminidase; enzyme; laundry; cleaning agent; hydrolysis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Score 45; DB 5; Length 698; Pred.                                                             enzymes (AAW85599-605) can be used in combination in
                                                                      an aqueous laundry or cleaning product. The cleaning product is used especially used to launder fabrics and to clean dishes and tableware, particularly in an automatic dishwasher, but may also be used generally as hard surface cleaner. The cleaning product imparts antimicrobial activity and/or eliminates biofilm, the hexosaminidases having a minimum inhibitory concentration of less than about 0.125% but more preferably less than about 0.025%. (NB: entry was revised to change incorrect cross references in Comments field)

human Talin. Also described: (a) an antisense compound up to 30 bases in length which inhibits the expression of human Talin; (b) a composition [II] comprising [I] or (a); and (c) inhibiting the expression of human Talin in human cells or tissues comprising contacting the cells or tissues in vitro with (I) or (a). (I) has antimicrobial, antinflammatory and cytostatic activities, and can be used in antisense gene therapy and as a Talin expression inhibitor. (I) can be used: to inhibit the expression of human Talin in human cells or tissues; to prevent or delay infection, inflammation or tumour formation; and in diagnostics, the reapentics, prophylaxis, and in research reagents and kits. The present sequence represents human Talin from the present invention

                                                                                                                                                                                                                            autonomous parvovirus, minute virus of mice.";
Nucleic Acids Res. 13:3617-3633(1985).
-!- FUNCTION: Seems necessary for viral DNA replication.
-!- SIMILARITY: Belongs to the parvoviruses noncapsid protein family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           -!- FUNCTION: Seems necessary for viral DNA replication.

Goto H., Shinagawa M.;
"Construction and nucleotide sequence analysis of an infectious DNA
clone of the autonomous parvovirus, mink enteritis virus.";
J. Gen. Virol. 72:867-875(1991).
-!- FUNCTION: Seems necessary for viral DNA replication.
-!- SIMILARITY: Belongs to the parvoviruses noncapsid protein family.
                                                                                                                      "Mapping specific functions in the capsid structure of canine parvovirus and feline panleukopenia virus using infectious plasmid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Viruses; ssDNA viruses; Parvoviridae; Parvovirinae; Parvovirus

-1- FUNCTION: Seems necessary for viral DNA replication.
-1- SIMILARITY: Belongs to the parvoviruses noncapsid protein family.
                                                                                                                                                                                                                                                                                                                                                                           ö

it forms oxaloacetate, a four-carbon dicarboxylic acid source for
the tricarboxylic acid cycle.
-i- CATALYTIC ACTIVITY: Phosphate + oxaloacetate = H(2)O +
phosphoenolpyruvate + CO(2).
-i- ENZYME REGULATION: By light-reversible phosphorylation.
-i- PATHWAY: Tricarboxylic acid cycle.
-i- SUBUNIT: Homotetramer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

Hermans J., Westhoff P.;
"Homologous genes for the C4 isoform of phosphoenolpyruvate
carboxylase in a C3 and a C4 Flaveria species.";
Mol. Gen. Genet. 234:275-284(1992).
-!- FUNCTION: Through the carboxylation of phosphoenolpyruvate (PEP)
it forms oxaloacetate, a four-carbon dicarboxylic acid source for
the tricarboxylic acid cycle.
-!- CATALYTIC ACTIVITY: Phosphate + oxaloacetate = H(2)O +
phosphoenolpyruvate + CO(2).
                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ENZYME REGULATION: By light-reversible phosphorylation.
PATHWAY: Tricarboxylic acid cycle. This isozyme is involved in C4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PROSITE, PS00393; PEPCASE 2; 1.

Patent No. 585938
GENERAL INFORMATION:
APPLICANT: Myserowitz, Elliot M.
APPLICANT: Williams, Robert W.
TITLE OF INVENTION: Plant Clavatal Nucleic Acids,
TITLE OF INVENTION: Transformed Plants, and Proteins
NUMBER OF SEQUENCES: 11
CORRESPONDENCE ADDRESS:
SOFTWARE: Patentin Release #1.0, Version #1.30 CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/473,553A FILING DATE: 06-JUN-1995 CLASSIFICATION: 800 ATTORNEY/AGENT INFORMATION:

GENERAL INFORMATION:
APPLICANT: GARY BRETON
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PROTEUS MIRABILJ
TITLE OF INVENTION: NUCLEIC ACID AND THERAPEUTICS
FILE REFERENCE: 2709.1002-001
CURRENT APPLICATION NUMBER: US/09/543,681A
CURRENT FILING DATE: 2000-04-05
PRIOR PILING DATE: 1999-04-09
PRIOR FILING DATE: 1999-04-09
SEQ ID NO 6712
